

GEO Submissions and Usage

Stephen Wilhite (wilhite@nih.gov)

NCBI Genome Resources Workshop

PAG XXVII January 14, 2019

U.S. National Library of Medicine
National Center for Biotechnology Information

Why GEO?

- Permanent archiving/increased visibility & value/data sharing
- Publishing your results
- Digging into published data sets
- Exploring what's already available (new discoveries; support findings)

Common study types in functional genomics

Functional genomics experiments measure changes in the DNA (genome and epigenome), RNA (transcriptome), or interactions between DNA/RNA and proteins that influence the phenotype of a sample. Common branches of functional genomics include (Figure 7):

- genotyping;
- transcription profiling;
- epigenetic profiling;
- nucleic acid-protein interactions;
- meta-analysis.

Submitting data

GEO accepts many categories of high-throughput functional genomic data, including all array-based applications and some high-throughput sequencing data.

We aim to make data deposit procedures as straightforward as possible and will provide as much assistance as you require to get your data submitted to GEO. If you have problems or questions about submission, [e-mail us](#) with a brief description of the type of data you are trying to submit, and one of our curators will quickly get back to you.

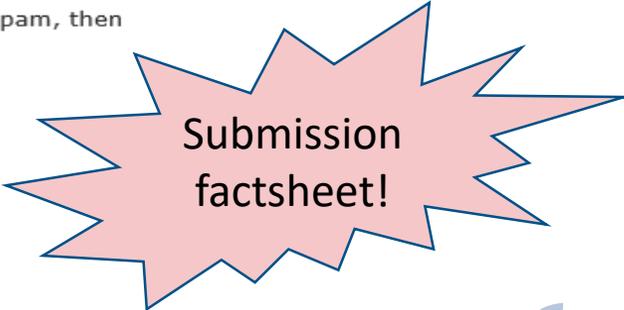

Data types

- Submit microarray
- Submit high-throughput sequencing
- Submit other (includes NanoString, RT-PCR, traditional SAGE)

WARNING: If you are submitting human data, it is your responsibility to comply with [Human Subject Guidelines](#).

Fast facts

- Your final GEO records will be organized as illustrated at [GEO Overview](#).
- See examples of the [kinds of data GEO can accept](#).
- GEO supports various submission formats:
 -  [GEOarchive spreadsheet submissions](#) are **recommended for most submitters**.
 - If your data and metadata are already in a database, and you can generate and export data in SOFT plain text or MINiML XML, you can use the [GEO Direct deposit](#) form to submit data.
- GEO accession numbers are normally approved [within 5 business days](#) after completion of submission. If you do not receive an e-mail from us within 5 business days of your submission, please first check your spam or junk e-mail folders because some systems recognize GEO e-mail correspondence as spam, then [e-mail us](#) to inquire about your submission.
- Your GEO submissions can [remain private](#) until a manuscript citing the data is published.
- You can allow [reviewers anonymous access](#) to your private records.
- You can [update or edit](#) your existing GEO records at any time.
- GEO supports [MIAME-](#) and [MINSEQE-compliant](#) data submissions.

[Query DataSets for GSE104286](#)

Status	Public on Dec 25, 2018
Title	Transcriptomic study of soybean (<i>Glycine max</i>) leaves in response to short-term phosphorus deficiency
Organism	Glycine max
Experiment type	Expression profiling by high throughput sequencing
Summary	We conducted a genome-wide transcriptomic analysis in soybean leaves treated with a short-term (24 h) Pi-deficiency using RNA sequencing (RNA-seq) technology. Two biological replicates of RNA-seq were included for both Pi-sufficient leaves (PSL) and Pi-deficient leaves (PDL), and therefore a total of four libraries were constructed. Using a 2-fold change and a P-value ≤ 0.05 as the cut-off for selecting the differentially expressed transcripts, we globally identified short-term Pi-stress responsive genes. Some DEGs potentially involved in Pi sensing, signaling, and homeostasis were up-regulated by Pi deprivation, including five SPX-containing genes. Some DEGs possibly associated with water and nutrient uptake, hormonal and calcium signaling, protein phosphorylation and dephosphorylation, and cell wall modification were affected at the early stage of Pi deprivation. At least thirty-one transcription factor genes belonging to 10 diverse families were found to be responsive to Pi starvation.
Overall design	The first trifoliate true leaves of soybean were harvested after 24 h treatment with or without phosphate, and RNA was extracted and sequenced by paired-end sequencing. RNA sequencing reads were aligned against the soybean reference genome and differentially expressed genes between treatments were detected.

▼ **Quick start**

- Specify a GEO Series accession and a Platform if prompted.
- Click 'Define groups' and enter names for the groups of Samples you plan to compare, e.g., test and control.
- Assign Samples to each group. Highlight Sample rows then click the group name to assign those Samples to the group. Use the Sample metadata (title, source and characteristics) columns to help determine which Samples belong to which group.
- Click 'Top 250' to perform the calculation with default settings.
- Results are presented as a table of genes ordered by significance. The top 250 genes are presented and may be viewed as profile graphs. Alternatively, the complete results table may be saved.
- You may change settings in Options tab.

Gene Expression Omnibus

GEO is a public functional genomics data repository supporting MIAME-compliant data submissions. Array- and sequence-based data are accepted. Tools are provided to help users query and download experiments and curated gene expression profiles.

Getting Started

[Overview](#)[FAQ](#)[About GEO DataSets](#)[About GEO Profiles](#)[About GEO2R Analysis](#)[How to Construct a Query](#)[How to Download Data](#)

NCBI Genome Resources Workshop

Time	Topic
12:50 – 1:10	Submission of Genomes to GenBank <i>Karen Clark</i>
1:10 – 1:30	GEO Submissions and Usage <i>Steve Wilhite</i>
1:30 – 1:55	From Annotation to Visualization: Exploring Genes and Genomes with NCBI Tools <i>Eric Cox</i>
1:55 – 2:15	Programmatic Access to Genomic Data: E-Utilities and FTP <i>Vamsi K. Kodali</i>
2:15 – 2:35	NCBI Resources for Phyletically-Defined Next Generation Analysis in and out of the Cloud (a.k.a. Cool New Stuff!) <i>Ben Busby</i>
2:35 – 3:00	Q & A session
